Majumdaar Hosiery ERP · how it works

One-page reference to the logic behind every screen: how a document moves stock and money, how lot costs are built up, how GST, accounts, roles and reports are calculated, and where the data lives.

`Node.js + browser` `no add-ons to install` `SQLite · erp.sqlite` `Hostinger Web App` `agencies & godowns` `9 roles · 34 areas` `39 reports`

PROCESS FLOW · ONE LOT FROM YARN TO CASH

Each step is a document. Saving it moves stock between the four locations and carries the lot's cost forward.

Step 1 — Purchase
`PO → GRN → PB → PAY`
Order yarn, dyes & chemicals, packing. GRN brings stock in at the PO rate and gives each yarn / fabric line its **lot number** (`L-0001`). Bill adds GST and creates the payable.
`Supplier → Main Store`

Step 2 — Yarn issue
`TRF · Yarn Issue`
Store sends yarn (by its lot) to the knitting agency chosen; prints as a job work challan. Cost moves with it.
`Main Store → knitting agency`

Step 3 — Knitting
`KNT · keeps lot L-0001`
The agency's yarn → grey fabric under the **same lot number** (kg, rolls, GSM), sent **straight to the dyeing agency** chosen: no transfer entry. Wastage and job charges recorded.
`knitting → dyeing agency`

Step 4 — Dyeing
`DYE · recipe (BOM)`
Grey lot at the agency (+ dyes & chemicals if we supply them) → coloured lot. Colour, shade, wastage, job charges.
`dyeing → finishing agency`

Step 5 — Finishing & packing
`FIN · overhead added`
Coloured lot at the agency (+ packing if we supply it) → finished rolls (kg, rolls, meters). Month's overhead absorbed here.
`finishing agency → godown`

Step 6 — Sales
`QT → SO → DC → INV`
Quotation, order at the customer's price (kg or rolls); challan dispatches the lot from a godown; tax invoice raises the receivable.
`Godown → Customer`

Step 7 — Collection
`RCT`
Receipt in one mode or split (cash + bank …) into an account; the rest stays on credit; oldest dues settle first.
`Customer → bank / cash`

LOC Locations & lots

CODE	LOCATION	HOLDS
`STORE`	Main Store	Yarn, dyes & chemicals, packing
agency	Each job-work agency	Our material lying with it: yarn at a knitter, grey at a dyeing house, dyed fabric at a finisher
`FG`	Finished Goods Store	Packed finished rolls
`KNIT` `DYE`	Knitting / Color Factory	Own-factory work only; can be marked *Not in use*

- **Agencies:** a party of type Job Worker (or one that ticks knitting, dyeing or finishing) gets a location of its own, named after it, when it is saved; renamed with it, removed with it if nothing was ever sent there. Several agencies per kind of work.
- **Stock is kept per item + location + lot.** The same item in two lots is two separate stock lines.
- **One lot number from purchase to sale.** The GRN gives each yarn or fabric line the next free number (`L-0001` , `L-0002` …); opening stock gets one the same way. Nobody types it. Knitting keeps the lot of the main yarn (the yarn line with the most kg), dyeing and finishing keep the lot they take in, and the challan / invoice sells from it. Dyes, chemicals and packing have no lot.
- **Each production entry names the agency** that did the work: the input is taken from that agency's stock. Its output goes where the entry says: grey to a dyeing agency (or kept at the knitter until *Send Grey for Dyeing*), dyed fabric to a finishing agency (or kept when the dyeing house also finishes), finished rolls to the FG Store. Entries made before agencies keep the Knitting / Color Factory.
- **Rolls are an average; billing is by kg.** Any kg taken from a lot (sale, transfer, dyeing, finishing) takes its rolls in proportion: 1,000 kg in 300 rolls → 100 kg = 30 rolls; the last kg take what is left. A count typed on a line is kept; rolls typed without kg give kg at the lot's average (or Settings' 17 kg). Dyed and finished output keeps the rolls taken in.
- **Optional (Settings): rolls weighed one by one** at finishing (`20.2 + 50.3 + 39.5` → 110 kg, 3 rolls). A sale then takes whole rolls in roll order and cuts the last, or the rolls picked on the challan; stock shows the kg left on each roll.
- Issues and consumptions pick the lot from a list that shows the quantity available there. One yarn lot knitted into two fabrics (e.g. single jersey and rib) keeps one number: stock and colour are kept per item + lot.

DOC What each document does

DOCUMENT	STOCK	MONEY
Purchase order `PO`	—	— (pending tracked)
Goods receipt `GRN`	+ at chosen location, qty × rate	—
Purchase bill `PB`	—	Supplier credited (payable), input GST
Supplier payment `PAY`	—	Supplier debited
Transfer `TRF`	– from, + to (same lot, same cost)	—
Opening / adjustment `ADJ`	+ qty at rate, or – qty (write-off)	—
Knitting `KNT`	– yarn at the knitting agency, + grey lot at the dyeing agency chosen (or kept at the knitter)	Job charges into lot cost; agency credited
Dyeing `DYE`	– grey lot at the dyeing agency, – chemicals at STORE (if we supply), + coloured lot where it is sent	Chemicals + job charges into lot; agency credited
Finishing `FIN`	– coloured lot at the finishing agency, – packing at STORE (if we supply), + finished lot at FG (each roll weighed)	Packing + job charges + overhead into lot; agency credited
Overhead `OH`	—	Spread over the month's finished kg
Sales order `SO`	—	— (credit check, pending tracked)
Delivery challan `DC`	– finished lot at FG, roll by roll	Fixes cost of goods sold
Invoice `INV`	– at FG only if no challan	Customer debited (receivable), output GST
Receipt `RCT`	—	Customer credited
Labour payment `LP`	—	Own-factory labour only: reduces labour payable for its process

LINK Documents that fill from another

- **PO → GRN:** loads only the **pending** quantity per item (ordered – already received against that PO).
- **GRN → Purchase bill:** copies all lines with each item's GST %. A GRN can be billed only once.
- **SO → Delivery challan:** loads pending quantity (ordered – already dispatched); you pick the lot.
- **Challan → Invoice:** copies items, lots, kg and rolls. A challan can be invoiced only once.
- **Rates:** sales lines take the customer's price-list rate (latest "effective from"), else the item's standard rate. Purchase lines take the item's standard rate. GST % always comes from the item.
- **Recipe (BOM):** picking a recipe in dyeing or finishing fills the materials as `qty per kg × input kg` , and rescales if the input kg changes (until you edit a line).
- **Lot pick:** in dyeing/finishing, choosing the lot fills the input kg with what is available; the output keeps the same lot number.

STOCK Stock engine

- Only documents are saved. **Stock, ledger, lot cost, wastage and balances are recalculated** by replaying every document in date order (same date: order of entry). So editing or deleting an old entry corrects everything after it.
- **Valuation** (Settings): **Weighted average** (default) or **FIFO** per stock line. Production lots are valued at their exact built-up cost.
- **No negative stock.** Every save, edit and delete is test-replayed first; if it would make any item/location/lot go below zero, it is refused with the item, lot and shortfall (e.g. *"short by 340"*). An admin can switch this off in Settings; shortages then show in *Stock Exceptions*.
- Rolls are counted alongside kg; meters are recorded at finishing.
- Stock reports can be run "as on" any past date, lot-wise or item-wise, with value and re-order alerts.

COST Exact lot costing

Every kg carries its cost split into **buckets**: yarn · dyes & chemicals · packing · other material · knitting charges · dyeing charges · finishing charges · overhead · wastage. The buckets travel with the fabric, so a finished lot knows exactly what it cost and why.

```
At each stage:
w            = wastage kg ÷ input kg
wastage cost = w × input cost − scrap sale value
output cost  = input cost × (1 − w)
             + wastage cost  (kept in the wastage bucket)
             + materials added + job charges (+ overhead)
cost per kg  = total ÷ finished kg   (also per roll, per meter)
```

Worked example (from the test run): 600 kg yarn @ ₹250 = 1,50,000 + chemicals 8,190 + packing 120 + job charges 5,265 (knitter, ₹9/kg) + 8,775 + 3,360 (dyeing house) + overhead 11,200 = **₹1,86,910 for 560 kg = ₹333.77/kg**. Wastage is part of the total, never added twice.

PROD Wastage, job charges & overhead rules

- **Wastage** fills in as `input − output` until you type your own. If you enter less, the rest is **process loss** and its cost stays in the good fabric.
- **Job charges** fill in as `rate × kg` : the agency's own rate (on its party) or else the Process master's standard rate; knitting and finishing on **output** kg, dyeing on **input** kg. They can be overwritten with a lump sum.
- **Overheads** (factory, power/water, machine running, maintenance, other) are totalled per month and charged to lots finished that month at `month's overheads ÷ month's finished kg` . A month with no finishing shows as **unabsorbed** in the Overhead Absorption report.
- Lot tracking starts at the GRN (supplier, kg received) and follows the lot to sales. Yield = finished kg ÷ yarn kg knitted.

P&L Profitability

```
profit = sale value − cost of goods sold
sale value = line amount − its share of invoice discount (ex-GST)
COGS       = exact lot cost of the kg dispatched
```

Cost is taken from the challan (or the invoice when there is no challan). Shown per invoice line, or grouped by customer, item or lot. Dashboard gross profit uses the same calculation.

GST GST logic

- **Rate and HSN per item**, filled into every line; editable per line.
- **Place of supply** = the invoice's own field, else the party's state. Same state as the company → **CGST + SGST** (half each); different → **IGST**.
- **Freight & other charges** on the invoice are part of the taxable value, spread over the lines by value and taxed at each line's rate. A **discount** reduces taxable value **before** GST.
- Grand total rounded to the rupee (round-off shown).
- **States** come from a fixed list with GST codes (e.g. West Bengal 19). **GSTIN** must be 15 characters in the official pattern and its first two digits must match the state; blank = unregistered.
- **Tax invoice print:** both GSTINs with state codes, HSN per line, kg and rolls with each roll's weight, place of supply, HSN-wise tax summary, amount in words, bank details, terms, signature, and Original / Duplicate / Triplicate copy label.
- **GST Summary** report: month-wise output tax (sales) – input tax (purchase bills) = net payable or credit.
- **Sales / Purchase Register** with GSTIN, place of supply, B2B / B2C. **GSTR-1 data**: B2B by invoice and rate, B2C Large (inter-state, unregistered, above ₹1,00,000), B2C Small by place of supply and rate, HSN summary (UQC KGS), documents issued. **GSTR-3B**: 3.1 outward taxable and nil-rated, 4(A)(5) ITC from registered suppliers' bills, net per head before set-off. For the accountant to check before filing.

ACC Accounts, dues & credit

ENTRY	PARTY LEDGER
Opening balance	Dr or Cr as set on the party
Sales invoice	Dr (customer owes us)
Receipt	Cr
Purchase bill	Cr (we owe supplier)
Payment	Dr

- **Balance** = Dr − Cr. Positive = receivable, negative = payable.
- **Ageing** 0–30 / 31–60 / 61–90 / 90+ days assumes payments settle the **oldest** bills first.
- **Credit control:** saving a sales order or invoice that takes a customer above the credit limit asks for confirmation (warning, not a block). Outstanding report flags *Over limit* and *Overdue* (oldest due older than credit days).
- Payment and receipt screens show the party's current balance before you enter the amount.
- **Agency accounts:** each production entry at an agency credits that agency with its job charges (party ledger: *Knitting charges, lot L-0001, 585 kg*). They show under Payables and are paid in Supplier Payments.
- **Labour payable** (own factory only) per process = labour on entries at your own factory − labour payments. Settings can set the date it counts from (earlier labour treated as settled).
- **Paid / balance per bill:** a receipt naming an invoice settles it first; all other money settles the oldest bills first. Invoice status: *Paid, Part paid, Unpaid,* or *Overdue* once its due date (or date + credit days) has passed. Purchase bills likewise against payments (agency job charges count among the bills).
- **Split receipt / payment:** parts in different modes and accounts (₹20,000 cash + ₹30,000 bank); the amount is their sum.
- **Cheques count only once cashed:** until *Cleared in bank on* is filled, a cheque counts nowhere (party balance, bill paid status, outstanding, bank, collections); then it counts from that date (ledger row dated the day cashed). Split: only the cheque part waits. Cashed date ≥ entry date. Report *Cheques Not Yet Cashed* + dashboard alert.
- **Payment details by mode:** Cheque → cheque no. (required), date, bank & branch · UPI → phone / UPI ID, transaction ID · Bank Transfer → NEFT / RTGS / IMPS, UTR, their bank (+ supplier's A/C & IFSC) · Online → paid through, txn ID · Cash → who took / got it, receipt-book no. Details of another mode are dropped on save; each split part keeps its own. The party master's bank, A/c, IFSC and UPI ID fill in by themselves. Shown in lists, vouchers, party ledger, bank book and customer card.

BANK Bank & cash

- **Accounts:** Cash in Hand (built in) + each bank account with an opening balance (minus = overdraft).
- **Money in:** receipts (each part to its account), interest / other receipts. **Money out:** payments, labour payments, expenses, salaries & advances, EMIs, electricity bills on their paid date, bank charges. **Between accounts:** cash deposit, cash withdrawal, transfer.
- Mode *Cash* → Cash in Hand by itself; other modes → the bank chosen. Entries with no account count in the bank set in Settings, else under *Not assigned*.
- **Reconciliation** (as on a date): balance as per bank = books – received not yet credited + paid not yet debited; an entry counts as cleared once its *Cleared in bank on* date is filled.

EXP Expenses, electricity bills & EMIs

- **Expense heads:** electricity, rent, repairs & maintenance, machine running, factory overheads, transport, staff salary, job work charges, office, telephone / internet, miscellaneous. Factory heads tick *Add to production cost* by themselves; only ticked expenses are overheads.
- **Electricity bill:** month, units, amount, due date; paid on / amount / account when paid. Added to production cost for its bill month. Status: overdue · due today · due in ≤ 7 days · paid.
- **Loan:** EMI, number of EMIs, first EMI date; EMIs fall due monthly on that day. Each EMI payment counts one EMI, in order. Next due = first EMI date + EMIs paid (months). Status: *Overdue n days · Due today · Due in ≤ 3 days · Paid this month · Closed.* Still to pay = EMIs left × EMI.

HR Staff, attendance & salary

- **Attendance** once per day: P present · H half day · A absent · L paid leave · O holiday / weekly off. A new sheet lists everyone working as present.
- **Monthly staff:** salary × (days in month – absent – ½ × half days – days before joining) ÷ days in month. Days not marked count as worked.
- **Daily wage:** rate × (present + paid leave + holiday + ½ × half days).
- **Salary payment** for a month: paid + advance recovered settles the salary due. **Advances** outstanding = advances given – recovered.
- Salaries are hidden from logins without *Salaries & advances*; their staff list shows no pay and their saves cannot change it.

JOB Job work tracking

- **Challans:** yarn issue (expected fabric, job rate, expected date) and grey for dyeing (colour & shade wanted, rate, expected date) print as job work challans.
- **Job Work Register:** every send to an agency (transfers, and output sent straight on from the last agency). What is still at the agency is matched to its **newest** sends of the same lot (older ones were worked first) → kg still there, kg worked, *Overdue* once the expected date has passed.
- **Processing Status:** grey at an agency = 🟡 material sent; dyed = 🟣 finishing; finished into a godown = ✅ received. A status update (🔵 processing started · 🟠 colouring · 🟣 finishing · 🟢 finished & ready) dated on or after the material arrived replaces the automatic one.
- **Agency Summary:** kg sent, worked, delivered, wastage %, lying there, late sends, charges, payable.

GDN Godowns, kg & rolls

- **Godowns** = the Finished Goods Store + every location of type Godown. Finishing sends rolls to a godown; challans and invoices sell from one; a **Godown Transfer** moves rolls between godowns, each keeping its weight.
- **Godown Stock:** kg and rolls of each item / lot in each godown side by side, with average kg per roll.
- Stock keeps kg and rolls together, with the **average kg per roll** of each lot. Rolls typed without kg on an order or quotation are estimated at the average roll weight in Settings (17 kg).
- **Yarn Stock:** opening + purchased – used in knitting ± adjustments = closing, split into available in store and lying at knitting houses.

CRM Customers, leads & quotations

- **Lead:** prospect or customer, requirement, colour, kg, stage (new → contacted → quotation sent → negotiation → won / lost), follow-up lines; the latest line's next date becomes the lead's next follow-up.
- **Follow-ups:** open leads by next date, overdue first. **Quotation:** to a customer or a prospect, with GST; a sales order can copy it.
- **Customer Card:** profile, outstanding, overdue, sales this FY, invoices with paid / balance, payments, open orders, leads.

MST Masters

Items	Code, name, category (Yarn · Dyes & Chemicals · Packing Material · Others · Grey Fabric · Colored Fabric · Finished Goods), unit, HSN, GST %, standard rate, re-order level. Names and codes must be unique.
Parties	Supplier · Customer · Job Worker (agency) · Both; state, GSTIN, credit limit & days, opening balance. Agencies tick the work they do (knitting, dyeing, finishing) with a rate per kg for each. Customer Master is the same list filtered.
Units	Kg, Nos, Roll, Mtr, Ltr, Pcs, Box (+ your own).
Machines	Code, type (knitting/dyeing/finishing), dia, gauge, feeders, capacity, status; machine-wise output on the knitting page.
Processes	Stage + standard rate ₹/kg, used when an agency has no rate of its own.
BOM / Recipes	Dyeing recipes and packing standards as qty per kg.
Price list	Customer + item + rate + effective-from date.

Dropdowns only offer sensible items: knitting shows yarn, dyeing shows grey fabric and dyes & chemicals, sales show finished goods, and so on.

USER Users, roles & sign-in

- **Administrator** has everything, including users, roles, settings, backup and restore.
- Every other login has a **role**. A role sets one level for each of **34 areas**: `No access` hidden and blocked · **View** open & print · **Add & edit** · **Full** also delete.
- **Approvals** (Settings): a change or deletion of a saved bill, invoice, receipt, payment, expense, stock or production entry by staff is held until the administrator (or a role with *Approve*) accepts it, then made exactly as asked, under the asker's name. Own entries can be corrected the same day; new entries are never held. If the entry changed meanwhile, approval is refused.
- **Activity log** (admin only): sign-ins, failed sign-ins, every record created / changed (which fields) / deleted, requests, approvals, settings, backups.
- **The server enforces it**, not just the menu: typing a blocked screen's address shows *No access*, and lists only contain records the role may see.
- Masters are readable by everyone (needed for dropdowns); changing them needs the Masters area. Transfers split by purpose: grey transfer belongs to Knitting, yarn issue to Store.
- Role edits apply to everyone with that role at once.
- **Sign-in is per browser tab**: reload keeps you signed in as yourself; a new tab asks to sign in; closing the tab signs out. Sessions end after 12 hours idle. They are kept on disk (as a hash, never the token), so a restart or update signs nobody out.
- Passwords: minimum 6 characters, stored scrambled (scrypt), never shown. Usernames have no spaces; capitals don't matter. Inactive users cannot sign in. Admin cannot delete or demote themselves.
- **Sign-in protection:** 5 wrong passwords for one user from one address (or 30 from one address) pause sign-in there for 15 minutes. The server warns while the admin password is still the default.

ROLE Ready-made roles

ROLE	MAINLY WORKS ON
Management	Everything except users & roles
Purchase	Masters, POs, bills; sees GRN & payments
Store / Inventory	GRN, yarn issue to agencies, opening stock; sees POs
Knitting	Knitting per agency (grey goes to the dyeing agency chosen); send grey for dyeing; status updates
Dyeing / Color	Dyeing; status updates
Finishing & Packing	Finishing; status updates
Sales	Customers, leads, quotations, prices, SO, challans, invoices; sees receipts
Finance & Accounts	Bills, payments, receipts, bank & cash, expenses, electricity bills, EMIs, staff & salaries, GST reports, MIS dashboard
Data Entry	Add & edit in every module, no delete; no costing or accounts reports

All roles are editable, and new ones can be created.

MIS Dashboards

- **Today & alerts** (top of the business overview): sales today and this month, collected and spent today, bank & cash balances; alerts for overdue invoices, job work past its expected date, EMIs and electricity bills due, follow-ups due, items below re-order level, changes waiting for approval.
- **Business overview** (roles with the MIS dashboard): sales with gross profit trend, receivables by age, payables, six tiles with trend lines, material in process at each stage, sales vs purchases, production flow with % yield, top customers, cost per kg by lot, stock value, wastage by stage, best sellers, re-order alerts, recent activity.
- **Department analytics** (everyone else): only their own area. Knitting/dyeing/finishing see kg, %, lots, output by agency, colours, chemicals and lots waiting at the agencies, **never money**. Store, purchase and sales see their own figures.
- **Period buttons:** this month, last month, 3 / 6 months, this FY (from 1 April), 12 months, or custom dates. Every tile compares with the **previous period of equal length** (▲▼ green when good, red when bad).
- Ranges up to 62 days are charted by day (trend lines as a running total); longer ranges by month. Every chart has a table view and links to its report.

RPT Reports

Inventory: Stock Summary · Yarn Stock / Stock Movement · Godown Stock · Stock Ledger · Stock Exceptions. **Purchase:** Purchase report · Pending POs. **Production:** Job Work Register · Processing Status · Agency Summary · Production (by agency) · Batch/Lot Tracking · Wastage. **Costing:** Lot Costing Sheet · Item-wise Costing · Overhead Absorption · Profitability. **Sales & CRM:** Sales report · Pending SOs · Customer Card · Follow-ups. **Accounts:** Outstanding (receivable/payable) · Party Ledger · Bank & Cash Book · Bank Reconciliation · Expense Report · Electricity Bills · EMI & Loan Status · Labour Payable. **Staff:** Salary Register · Attendance Sheet. **GST:** GST Summary · Sales Register · Purchase Register · GSTR-1 data · GSTR-3B summary · Party GST details. **Admin:** Activity Log.

All filterable (dates, party, item, location, stage), exportable to CSV and printable. Clicking a row opens the document behind it. Each report group is a separate permission.

RULE Checks on save

- Date and required fields; at least one line; quantities above zero (adjustments may be negative, not zero).
- Lot numbers are given only by the ERP (a typed number on a new GRN line is replaced); an agency is chosen only for work it ticks; grey fabric cannot go to a godown and finished rolls go only to one; challans and invoices sell only from a godown; a godown transfer goes godown to godown; transfer "from" and "to" must differ; output kg required for production. Roll weights must be numbers; rolls picked must add up to the line's kg and still be in stock.
- One attendance sheet per day; a salary names its month; a loan needs its EMI and first EMI date; accounts chosen must exist; a quotation needs a customer or a prospect.
- Unique names: items, parties, units, locations, machine codes, processes, recipes, usernames.
- **Delete is blocked** when a record is used elsewhere (e.g. an item on a PO, a GRN already billed) or when deleting would break stock later.
- Edits keep the document number; numbers are only issued once a save succeeds.
- Every entry records who created and last edited it, and when.

NO. Numbering

`PO · GRN · PB · PAY · TRF · ADJ · KNT · DYE · FIN · PS · EXP · SO · QT · DC · INV · RCT · LP · BNK · EB · EMI · ATT · SAL · LD`

Each series runs continuously with four digits (`INV-0001` , `INV-0002` …). Lots run `L-0001` upwards, given at the GRN; Settings can switch to a pattern such as `MH-{YYYY}-###` (MH-2026-001, again from 001 each year). Lots already given keep their numbers.

UI Working on the screens

- **Dark theme** by default; sun/moon button switches to light (remembered per computer). Printed documents and reports are always white.
- **Full screen** starts when you sign in; **Esc** returns to normal; the ⛶ button re-enters.
- **Guidance panel** on every entry screen: what is missing (no agency yet, yarn not issued to the agency, no grey lot waiting there, chemicals or packing short, item in the wrong category or store), where the stock is instead, the step that fixes it (button, or which department to ask) and what comes next. Short lines get a note underneath; stock errors on save say what to do.
- **Ctrl + S** saves a form; Save & new; Print on saved documents. **Enter** opens a highlighted list row.
- Each menu box has its own colour and the screen it opens uses the same colour.
- Works on a phone or tablet through the online address.

DATA Data, backup & safety

- All data is in one **SQLite database**, `erp.sqlite` (SQLite is built into Node.js, nothing to install). One table per area (items, parties, invoices, knitting …) with readable number, date and name columns.
- Each save writes only the changed rows **in one transaction**: stored completely or not at all, so a power cut cannot leave a half-saved entry. If the disk refuses SQLite's fast mode, the ERP switches to the simpler mode by itself.
- **Online:** a Hostinger Business Node.js Web App deployed from GitHub. The database lives in its own folder set by `DATA_DIR` (e.g. `/home/<u-number>/erp-data`), outside the app folder that Hostinger replaces on every deploy. Steps in `DEPLOY.md` .
- **Backups:** the server saves a copy **once a day** by itself into `backups/` beside the database, keeping the newest 30. Settings → Download backup (JSON, restorable) or Download database (SQLite file) for an office copy. **Restore** first saves the current database as `erp-before-restore-….sqlite` .
- **Startup log:** every start and any error is written to `server.log` beside the database, readable in File Manager.
- **Demo data** (12 months, 24 lots, 5 customers) loads only into an empty database.
- **Updates:** push to GitHub and redeploy; sign-ins are kept.
- **Sleep on Hostinger:** an unused app is stopped and starts again on the next visit, so that first page takes a few seconds (a *Waiting for the server…* note shows; reads retry by themselves). A 5-minute ping of `/api/health` keeps it awake.
- **Tests:** `npm test` runs the storage test, the API checks (243), the two-tab sign-in check and a 134-step department walkthrough on a temporary database.
- The `activity` table holds the activity log; `approvals` the changes waiting for the administrator.

NEXT Not built yet

- Credit & debit notes (sales returns, rate differences)
- GST on agency job charges; GSTR-1 / 3B JSON for upload; e-way bill details; e-invoice (IRN/QR, needed above ₹5 crore turnover)
- ITC-04 for job work; ITC rules (2B matching, blocked credit, reverse charge)
- Invoice series restarting each financial year
- Tally-style shortcut keys and Alt + G search (proposed)
- Knitting recipes (fixed yarn blends) (proposed)

GST rates and HSN codes are set per item. Have your CA confirm them.

Figures in the costing example come from the automated end-to-end test.
